Technologies Subject to Exploitation: Providing Context for the Priority of Common Weaknesses

| Technology Views | Archetypes |
|--------------------------------------|---|
| Web Application | Web browser, web-server, web-based applications and services, etc. |
| Industrial Control System | SCADA, process control systems, etc |
| Embedded System | Embedded Device, Programmable logic controller, implanted medical devices, avionics package |
| End-point Computing Device | Smart phone, laptop, and other remote devices that leave the enterprise and/or connect remotely to the enterprise |
| Cloud Computing | Software-enabled capabilities and services (either installed locally or offered via hosted services/cloud computing), such as Infrastructure-as-a-Service (IaaS), Platform-as-a-Service (PaaS) and Software-as-a-Service (SaaS) |
| Enterprise Application/System | includes Databases, Operating Systems, office products (such as word processing, spreadsheets, etc) |

| Domains | Description |
|---|---|
| E-Commerce | The use of the Internet or other computer networks for the sale of products and services, typically using on-line capabilities. |
| Banking & Finance | Financial services, including banks, stock exchanges, brokers, investment companies, financial advisors, and government regulatory agencies. |
| Public Health, Food & Water | Health care, medical encoding and billing, patient information/data, critical or emergency care, medical devices (implantable, partially embedded, patient care), drug development and distribution, food processing, clean water treatment and distribution (including dams and processing facilities), etc. |
| Energy | Smart Grid (electrical network through a large region, using digital technology for monitoring or control), nuclear power stations, oil and gas transmission, etc. |
| Chemical | Chemical processing and distribution, etc. |
| Manufacturing | Plants and distribution channels, supply chain, etc. |
| Shipping & Transportation | Aerospace systems (such as safety-critical ground aviation systems, on-board avionics, etc), shipping systems, rail systems, etc. |
| National Security | National security systems (including networks and weapon systems), defense industrial base, etc. |
| Government and Commercial Security | Homeland Security systems, commercial security systems, etc |
| Emergency Services | Systems and services that support for First Responders, incident management and response, law enforcement, and emergency services for citizens, etc. |
| Telecommunications | Cellular services, land lines, VOIP, cable & fiber networks, etc. |
| Telecommuting & Teleworking | Support for employees to have remote access to internal business networks and capabilities. |
| eVoting | Electronic voting systems, as used within state-run elections, shareholder meetings, etc. |

Common Weakness Scoring System (CWSS) Vignettes

Leveraging CWE/CWSS in Cybersecurity Standardization for Key ICT Applications in various Domains

| DOMAINS TECHNOLOGY VIEWS | E-Commerce, Finance & Banking | Public Health, Food & Water | Energy (including Smart Grid, nuclear power, oil/gas transmission) | Chemical | Manufacturing | Shipping & Transportation (includes aerospace, rail, etc) | National Security (includes weapon systems & defense industrial base) | Government and Commercial Security | Emergency Services (systems & services for First Responders, law enforcement, incident response) | Telecommunication | Telecommuting & Teleworking | e-Voting |
|---|-------------------------------|-----------------------------|--|----------|---------------|---|---|------------------------------------|--|-------------------|-----------------------------|----------|
| Web Applications | | | | | | | | | | | | |
| Real-Time Embedded Systems | | | | | | | | | | | | |
| Industrial Control Systems | | | | | | | | | | | | |
| End-point Computing Devices | | | | | | | | | | | | |
| Cloud Computing | | | | | | | | | | | | |
| Enterprise Application/ System | | | | | | | | | | | | |

Common Vignette for Domain

Vignette for Domain/Tech View

Common Vignette for Tech View

Common Vignette for Tech View

Common Weakness Scoring System uses Vignettes with Archetypes to identify top CWEs in respective Domain/Technology Views

Vignettes and Business Value Context

Vignette provides a shareable, formalized way to define a particular environment within a business domain:

- includes the role that software archetypes play within that environment, and an organization's priorities with respect to software security.
- Identifies essential resources and capabilities, as well as their importance relative to security principles such as confidentiality, integrity, and availability. For example, in an e-commerce context, 99.999% uptime may be a strong business requirement that drives the interpretation of the severity of discovered weaknesses.
- Allows CWSS to support diverse audiences who may have different requirements for how to prioritize weaknesses. CWSS scoring occurs within the context of a vignette.

Business Value Context (BVC) contains three main parts:

- (1) a general description of the security-relevant archetypes, assets, and interfaces that are of concern to the business domain
- (2) the security priorities of the business domain with respect to the potential outcomes that could occur if those archetypes are successfully attacked.
- (3) a Technical Impact, in which the business domain's security concerns are linked with the potential technical impact that could occur if weaknesses are discovered and exploited.

Vignettes and Business Value Context

| Domain | Vignette | Description | Archetypes | Business Value Context (BVC) |
|------------|-----------------------------------|---|--|--|
| e-commerce | Web-based Retail Provider | Internet-facing, E-commerce provider of retail goods or services. Data-centric - Database containing PII, credit card numbers, and inventory. | Database, Web client/server, General-purpose OS | Confidentiality essential from a financial PII perspective, identity PII usually less important. PCI compliance a factor. Security incidents might have organizational impacts including financial loss, legal liability, compliance/regulatory concerns, and reputation/brand damage. |
| Finance | Financial Trading / Transactional | Financial trading system supporting high-volume, high-speed transactions. | N-tier distributed, J2EE and supporting frameworks, Transactional engine | High on integrity - transactions should not be modified. Availability also very high - if system goes down, financial trading can stop and critical transactions are not processed. |

Vignettes and Business Value Context

| Domain | Vignette | Description | Archetypes | Business Value Context (BVC) |
|---------------|-----------------------|---|---|---|
| Public Health | Human Medical Devices | Medical devices - "implantable" or "partially embedded" in humans, as well as usage in clinic or hospital environments ("patient care" devices.) Includes items such as pacemakers, automatic drug delivery, activity monitors. Control or monitoring of the device might be performed by smartphones. The devices are not in a physically secured environment. | Web-based monitoring and control, General-purpose OS, Smartphone, Embedded Device | <p>Power consumption and privacy a concern. Key management important. Must balance ease-of-access during emergency care with patient privacy and day-to-day security. Availability is essential - failure of the device could lead to illness or death.</p> <p>Devices are not in a physically secured environment.</p> |
| Smart Grid | Smart Meters | Meter that records electrical consumption and communicates this information to the supplier on a regular basis. | Web Applications, Real-Time Embedded System, Process Control System, End-point Computing Device | <p>Confidentiality of customer energy usage statistics is important - could be used for marketing or illegal purposes. For example, hourly usage statistics could be useful for monitoring activities. Integrity of metering data is important because of the financial impact on stakeholders (consumers manipulating energy costs). Availability typically is not needed for real-time; other avenues exist if communications are disrupted (e.g., site visit).</p> |
